

1.

Create a comparison table listing the main differences between DDR3, DDR4, and DDR5 RAM, including speed, voltage, and typical use cases.

Feature	DDR3	DDR4	DDR5
Release Year	2007	2014	2020
Voltage	1.5 V	1.2 V	1.1 V
Speed	800 to 2133 MT/s	1600 to 3200 MT/s	4800 MT/s and above
Typical Use Cases	Older PCs, basic work, web browsing	Gaming, office work, video editing	High-end gaming, AI, 3D design , professional work
Power Use	High	Lower than DDR3	Lowest saves more power
Best For	Old computer	Most home and gaming PCs	High-performance PCS

2.

Open your laptop or desktop (with power disconnected), locate the RAM slots, and take a clear photo of the installed RAM module. Reinstall the RAM module and verify that your system boots up successfully. Refer to your device manual or a trusted YouTube guide if unsure about RAM removal and installation steps.

3.

List three key differences between HDD, SSD, and NVMe storage types, and for each, name one app or use case (from apps you use daily) that would benefit most from that storage type.

► Three Key Differences

- **Speed**

- **HDD:** Slow storage.
- **SSD:** Fast storage.
- **NVMe:** Fastest storage.

- **How They Store Data**

- **HDD:** Uses a spinning disk to store data.
- **SSD:** Uses memory chips. No spinning disk.
- **NVMe:** Also uses memory chips, but works faster than an SSD.

- **Connection**

- **HDD & SSD:** Connect using **SATA**.
- **NVMe:** Connects directly to the **PCIe** slot on the motherboard, so it is much faster.

► **Best Daily Use Case for Each**

1. HDD (Hard Disk Drive)

- **Best Use:** Storing photos, videos, movies, and backup files.
- **Why:** Gives a lot of storage at a low price.

2. SSD (Solid State Drive)

- **Best Use:** Daily apps like Google Chrome, Microsoft Word, Excel, and PowerPoint.
- **Why:** Starts Windows and opens apps much faster than an HDD.

3. NVMe SSD

- **Best Use:** Gaming, video editing, and large software.
- **Why:** Loads games and files very quickly, giving the best performance.

4.

Remove the storage drive (HDD or SSD) from your system, take a photo of the connector type (SATA, M.2, or NVMe), and reinstall the drive. Confirm that your device recognizes the storage after reassembly. Only perform this task if you have access to a device you are allowed to open. If not, find and share a YouTube video link showing the process for your laptop/PC model.
